Project	LLM	Quantity	Category	Description EN-US
todo-api	mistral	3	Authentication	TC031, TC035, TC039 - Attempt to perform an operation (update, delete and get) without an authentication token, but before performing the operation (update, delete and get) it also tried to create without a token to obtain the id to perform the operation and failed to return the id, receiving an unauthorized status code
todo-api	mistral	1	Required Characters	TC011 - Attempt to create user with password with maximum length, even sent maximum length, but did not send lowercase letter and digit in password, receiving success status code
todo-api	llama	1	Property Length	TC026 - Attempt to create to-do with title below the minimum acceptable size to receive error status code, the minimum was 1 and 1 char was sent resulting in success status code
todo-api	llama	1	Property Length	TC014 - Attempt to create a user with a password of exactly the minimum acceptable length to receive a success status code, the minimum was 6 and 5 chars were sent, resulting in an error status code
todo-api	llama	1	Required Characters	TC015 - Attempt to create user with password with maximum length, even sent maximum length, but only sent lowercase letters in the password, receiving error status code
todo-api	gemini	1	Property Length	TC006 - Attempt to create user with username below the minimum acceptable length to receive error status code, the minimum was 1 and 1 char was sent resulting in success status code
todo-api	gemini	2	Property Length	TC031, TC045 - Attempt to create and update to-do with title below the minimum acceptable size to receive error status code, the minimum was 1 and 1 char was sent resulting in success status code
todo-api	gemini	2	Required Characters	TC014, TC015 - Attempt to create user with password with minimum and maximum length, even sent maximum length, but only sent lowercase letters in the password, receiving error status code
todo-api	gemini	1	Misinterpretation	TC008 - Attempt to create a user with a minimum number of characters, used the correct size, but used a user already created in a previous test and received an error status code
todo-api	deepseek	1	Authentication	TC028 - Attempt to perform complete CRUD flow, in some operations it used authentication token, but in others such as GET, it did not use it, resulting in an unauthorized status code
restaurants-api	maritaca	2	JSON Deserialization	TC101, TC107 - Attempt to create and query dishes with "correct" test logic, including asserts, but there was a Json deserialization error due to the way the code was written
restaurants-api	maritaca	2	Property Requirement	TC134, TC135 - Attempt to update restaurant with operations performed missing mandatory properties, resulting in a different status code than expected
restaurants-api	mistral	1	Property Length	TC015 - Attempt to create a dish with a minimum price, the minimum value was 0.01 and 0 was sent, resulting in an error status code
shortener-api	gemini	1	Property Requirement	TC010 - Attempt to shorten URL without qrCode parameter expecting to receive error, but the parameter is optional
shortener-api	deepseek	1	Misinterpretation	TC012 - Attempt to shorten url by sending non-existent parameters to the API expecting to receive an error, but non-existent parameters are naturally ignored causing an error
shortener-api	deepseek	1	Property Length	TC016 - Attempt to shorten url with maximum url size of 2040 but sent 2060 receiving error status code
shortener-api	deepseek	1	Misinterpretation	TC017 - Attempt to obtain expired url after creation and application of delay, however delay was applied in the wrong place, before all operations instead of being applied between operations
shortener-api	qwen	1	Property Length	TC011 - Attempt to shorten url with expiration with minimum value, the minimum value was 1 and 0 was sent resulting in error status code
shortener-api	qwen	1	JSON Deserialization	TC013 - Attempt to shorten url without qrcode, in general it had correct logic but deserialization to assert failed
hotels-api	gpt	2	Property Requirement	TC008, TC009 - Attempt to use refresh token for authentication without sending mandatory property
hotels-api	gemini	2	Misinterpretation	TC024, TC030 - Attempt to create and update country with duplicate name and get error but there is no rule and explicit logic in the context
hotels-api	qwen	1	Authentication	TC011 - Attempt to query country without token to receive unauthorized but it is an endpoint without authentication and specified as such
supermarket-api	llama	2	Property Length	TC008, TC016 - Attempt to create and update category with name with maximum length, however the maximum is 30 and 41 provided receiving error
supermarket-api	llama	2	Property Length	TC030, TC043 - Attempt to create and update product with name with maximum length, however the maximum is 50 and 52 was provided receiving error
supermarket-api	qwen	1	Misinterpretation	TC023 - Attempt to list products with filter with non-existent categoryId expecting to receive error, but the list finds zero results as expected for the logic
supermarket-api	qwen	1	Misinterpretation	TC046 - Attempt to delete product with non-existent ID expecting to receive error but specification indicates not found
supermarket-api	qwen	2	Property Length	TC009, TC017 - Attempt to create and update category with name with maximum length, however the maximum is 30 and 32 was provided receiving error
supermarket-api	qwen	1	Property Length	TC030 - Attempt to create a product with a name above the maximum size, however the maximum is 50 and 42 was provided, receiving success instead of the expected error

	Grouped	Category	Description EN-US
	15	Property Length	Number of characters or numeric value in properties different from the allowed range
	7	Misinterpretation	Misinterpretation of the problem context or code without logic consistent with the problem
	5	Authentication	Absence or presence of authentication in flows that require or do not require authentication
	0	Required Fields	Misinterpretation of mandatory and optional parameters
	4	Required Characters	Absence of mandatory characters such as lowercase letters, uppercase letters, digits or special characters
	3	Json Deserialization	Problems in Json deserialization

	Total	Property Length	Misinterpretation	Authentication	Property Requirement	Required Characters	JSON Deserialization
